

# Viral Decontamination Services

## ATP Testing

*For complete peace of mind - measure microbial activity before and after our Biocide Fogging Services.*

Adenosine Triphosphate (ATP) is an energy molecule found in all living cells, including bacteria. An ATP testing system can detect the amount of organic matter that remains after cleaning a surface or device. The process of ATP testing is very straight-forward and easy to use and provides a rapid indicator of hygiene standards that would otherwise require lab testing. For additional peace of mind, we are able to offer on-site, instant ATP testing using the latest portable device. ATP testing can be completed before and after biocide fogging and usually within the same day. This will provide a measure of microbial activity before and after decontamination, which is a marker of the disinfectant activity. This does not test for viral pathogens.
